July 14 is Bastille day! It's also the day that support ends for a Microsoft server system! Here's what you can do about it.

You built your business with your own hands. Running, and growing, your business often means long days and late nights.

Wouldn't you do anything to protect it?

Microsoft has announced that on July 14, 2015 support is ending for Windows Server 2003. If your business is running on this legacy server after July 14, 2015, you could be at risk.

Your business and your employees could be affected. If your business-critical applications—such as payroll, accounting, HR, inventory, email and CRM—are running on Windows Server 2003, your business is at risk.

Your customers could be affected. Does your business accept credit cards? You'll be out of PCI compliance if you are still using Windows Server 2003.

So, what to do? The Computing Center can help you. We'll identify the applications and workloads that are effected, make recommendations for the target destination, which could be Windows Server 2012 R2, Microsoft Azure, Cloud OS or Office 365 or other technology. We can then plan plan and manage your migration.

An assessment will help get us started. Email us at sales@compcenter.com, or call us at 607-257-3524. July 14, 2015 is just around the corner and waiting until after the deadline approaches could mean you're spending the summer cleaning up. Migrate now and then plan your summer vacation!

As always, we look forward to talking to you about migrating from Windows Server or any other business technology question or issue you may have and help you craft a cost-effective solution that's suited specifically to your needs.

Could your business
be exposed?

If you're running apps on
Windows Server 2003, listen up!
